

## Spartan'10 Network Installation Instructions

### License Server:

1. Install Sentinel HASP Run-time from one of the following two places:

C:\Program Files\Wavefunction\Spartan10vXXX\HASPUserSetup.exe  
<http://www3.safenet-inc.com/support/hasp-srm/enduser.aspx>

2. Plug in the red HASP key and ensure the light is on and NOT blinking.
3. Ensure the key can be seen by the network by navigating a web browser to <http://localhost:1947> and clicking on the "HASP Keys" tab in the menu on the left. In the HASP Keys window, under the Actions column should be a "Products" button. Click this to open the window and confirm the software is what you ordered.

### Client Machines:

1. During installation of Spartan'10 select "Local HASP" and Sentinel HASP Run-time will be installed. It can also be installed from the links listed in the section above.
2. If client machines are on the same subnet as the license server, installation is complete. If clients are on a separate subnet or you're having difficulty obtaining a license, see next step.
3. For situations where the license server and the client machines are on separate subnets, navigate a web browser to <http://localhost:1947> and select "Configuration" from the menu on the left. Under the "Access to Remote License Managers" tab make sure "Allow Remote Access to Remote Licenses" is checked, along with "Aggressive Search for Remote Licenses". Click submit and retry using Spartan'10.
4. If the client still can't obtain a license, enter the IP address of the license server in the "Specify Search Parameters" field on the "Access to Remote License Managers" tab. Click Submit and retry using Spartan'10.
